CSC236 Homework Assignment #2

Induction Proofs on Program Correctness

Alexander He Meng

Prepared for October 28, 2024

Question #1

Consider the following program from pg. 53-54 of the course textbook:

```python
def avg(A):
    """
    Pre: A is a non-empty list
    Post: Returns the average of the numbers in A
    """
    sum = 0
    i = 0
    while i < len(A):
        sum += A[i]
        i += 1
    return sum / len(A)

print(avg([1, 2, 3, 4]))  # Example usage
```

Denote the predicate:

$$Q(j) : \text{At the beginning of the } j^{\text{th}} \text{ iteration, } \texttt{sum} = \sum_{k=0}^{i-1} A[k].$$

Claim:
$\forall j \in \{1, \ldots, len(A)\}, Q(j)$

Proof.

□

Question #2

Recall $Q(j)$ from Question # 1.

Denote the following predicate:

$$Q'(n) : 0 \leq n < len(A) \implies Q(n+1)$$

Claim:
Referencing the previous question, proving $\forall j \in \{1, \ldots, len(A)\}, Q(j)$ is equivalent to proving $\forall j \in \mathbb{N}, Q'(n)$.

Proof.
explain why it's equivalent □

Question #3

As follows below, Q6-Q10 respectively represent questions 6 through 10 from pp. 64-66 of the course textbook.

Q6:
Consider the following code:

```
def f(x):
    """Pre: x is a natural number"""
    a = x
    y = 10
    while a > 0:
        a -= y
```

```
            y -= 1
        return a * y
```

(a): Loop Invariant Characterizing `a` and `y`
wordsgohere

(b): Why This Function Fails to Terminate
wordsgohere

Q7:
(a) Consider the recursive program below:

```
    def exp_rec(a, b):
        if b == 0:
            return 1
        else if b mod 2 == 0:
            x = exp_rec(a, b / 2)
            return x * x
        else:
            x = exp_rec(a, (b - 1) / 2)
            return x * x * a
```

Preconditions:
wordsgohere
Postconditions:
wordsgohere
Denote the following predicate:

$$P(n) : something here$$

Claim: expresshowthisiscorrect

Proof.
wordsgohere

□

(b) Consider the iterative version of the previous program:

```
def exp_iter(a, b):
    ans = 1
    mult = a
    exp = b
    while exp > 0:
        if exp mod 2 == 1:
            ans *= mult
        mult = mult * mult
        exp = exp // 2
    return ans
```

Preconditions:
wordsgohere Postconditions:
wordsgohere
Denote the following predicate:

$$P(n) : somethinghere$$

Claim: expresshowthisiscorrect

Proof.
wordsgohere

□

Q8

Consider the following linear time program:

```
def majority(A):
    """
    Pre: A is a list with more than half its entries equal to x
    Post: Returns the majority element x
    """
    c = 1
```

```
    m = A[0]
    i = 1
    while i <= len(a) - 1:
        if c == 0:
            m = A[i]
            c = 1
        else if A[i] == m:
            c += 1
        else:
            c -= 1
        i += 1
    return m
```

Denote the following predicate:

$$P(n) : somethinghere$$

Claim: expresshowthisiscorrect

Proof.
wordsgohere

$\square$

Q9

Consider the bubblesort algorithm as follows:

```
def bubblesort(L):
    """
    Pre: L is a list of numbers
    Post: L is sorted
    """
    k = 0
    while k < len(L):
        i = 0
        while i < len(L) - k - 1:
```

```
            if L[i] > L[i + 1]:
                swap L[i] and L[i + 1]
            i += 1
        k += 1
```

(a): Denote the inner loop's invariant:

$$P(n) : something here$$

Claim: proveinnerloop

Proof.
wordsgohere

□

(b): Denote the outer loop's invariant:

$$P(n) : something here$$

Claim: proveouterloop

Proof.
wordsgohere

□

(c): Denote the following predicate:

$$P(n) : something here$$

Claim: expresshowthisiscorrect

Proof.
wordsgohere

□

Q10

Consider the following generalization of the `min` function:

```
def extract(A, k):
    pivot = A[0]
    # Use partition from quicksort
    L, G = partition(A[1, ..., len(A) - 1], pivot)
    if len(L) == k - 1:
        return pivot
    else if len(L) >= k:
        return extract(L, k)
    else:
        return extract(G, k - len(L) - 1)
```

(a): Proof of Correctness

$$P(n) : somethinghere$$

Claim: proofofcorrectnessclaim

Proof.
wordsgohere

$\square$

(b): Worst-Case Runtime
wordsgohere

Question #4

As follows below, VI, VII, X, XII, and XIV respectively represent questions 6, 7, 10, 12, and 14 from pp. 46-48 of the course textbook.

VI

Let $T(n)$ be the number of binary strings of length n in which there are no consecutive 1's.

So, $T(0) = 1, T(1) = 2, T(2) = 3, ...,$ etc.

(a): Recurrence for $T(n)$:
recurrencehere

(b): Closed Form Expression for $T(n)$:
closedformhere

(c): Proof of Correctness of Closed Form Expression
Denote the following predicate:

$$P(n) : somethinghere$$

Claim: expresshowthisiscorrect

Proof.
wordsgohere

□

VII
Let $T(n)$ denote the number of distinct full binary trees with n nodes. For example, $T(1) = 1, T(3) = 1, and T(7) = 5$. Note that every full binary tree has an odd number of nodes.
Recurrence for $T(n)$:
recurrencehere

$$P(n) : somethinghere$$

Claim: $T(n) \geq (\frac{1}{n})(2)^{(n-1)/2}$

Proof.
wordsgohere

□

X

A *block* in a binary string is a maximal substring consisting of the same symbol. For example, the string `0100011` has four blocks: `0`, `1`, `000`, and `11`. Let $H(n)$ denote the number of binary strings of length n that have no odd length blocks of `1`'s. For example, $H(4) = 5$:

$$0000 \quad 1100 \quad 0110 \quad 0011 \quad 1111$$

Recursive Function for $H(n)$:

$$P(n) : somethinghere$$

Claim: proveouterloop

Proof.
wordsgohere

□

Closed Form for H (Using Repeated Substitution):

XII

Consider the following function:

```python
def fast_rec_mult(): # maybe params needed?
"""FILL THIS IN!!!"""
```

Worst-Case Runtime Analysis:
wordsgohere

XIV

Recall the recurrence for the worst-case runtime of quicksort:

$$\begin{cases} c, & \text{if } n \leq 1; \\ T(|L|) + T(|G|) + dn, & \text{if } n > 1. \end{cases}$$

where L and G are the partitions of the list.

For simplicity, ignore that each list has size $\frac{n-1}{2}$.

(a): Assume the lists are always evenly split; that is, $|L| = |G| = \frac{n}{2}$ at each recursive call.

Tight Asymptotic Bound on the Runtime of Quicksort:

determinehere

(b): Assume the lists are always very unevenly split; that is, $|L| = n - 2$ and $|G| = 1$ at each recursive call.

Tight Asymptotic Bound on the Runtime of Quicksort:

determinehere
